Be ready. Be FIER.

Flooding - Infrastructure - Evacuation - Resilience

The Interreg North Sea project FIER aims to enhance societal resilience for and limit the impact of climate-induced floods.

This will be achieved by fostering behavioural change and bolstering crisis management infrastructure. Crucial ingredients in developing a more complete Multi-Layer Safety Approach.

Drawing from past EU projects and recent crises, FIER will develop new and innovative action plans and robust frameworks tailored to the North-Sea region. By the project end, participating regions aim to see a significant boost in societal resilience and enhanced flood management capability.
